Neural Network Basics

LATEST SUBMISSION GRADE

100%

1. What does a neuron compute?

1 / 1 point

- A neuron computes a linear function (z = Wx + b) followed by an activation function
- A neuron computes an activation function followed by a linear function (z = Wx + b)
- A neuron computes a function g that scales the input x linearly (Wx + b)
- A neuron computes the mean of all features before applying the output to an activation function

Correct, we generally say that the output of a neuron is a = g(Wx + b) where g is the activation function (sigmoid, tanh, ReLU, ...).

2. Which of these is the "Logistic Loss"?

1 / 1 point

- $\bigcirc \mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = |y^{(i)} \hat{y}^{(i)}|$
- $\mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = max(0, y^{(i)} \hat{y}^{(i)})$
- $\mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = |y^{(i)} \hat{y}^{(i)}|^2$
- $\mathcal{L}^{(i)}(\hat{y}^{(i)}, y^{(i)}) = -(y^{(i)}\log(\hat{y}^{(i)}) + (1 y^{(i)})\log(1 \hat{y}^{(i)}))$

Correct, this is the logistic loss you've seen in lecture!

3. Suppose img is a (32,32,3) array, representing a 32x32 image with 3 color channels red, green and blue. How do you reshape this into a column vector?

1 / 1 point

- x = img.reshape((32*32,3))
- x = img.reshape((32*32*3,1))
- x = img.reshape((3,32*32))
- x = img.reshape((1,32*32,*3))

```
1 a = np.random.randn(2, 3) # a.shape = (2, 3)
2 b = np.random.randn(2, 1) # b.shape = (2, 1)
3 c = a + b
```

What will be the shape of "c"?

- c.shape = (2, 1)
- \bigcirc c.shape = (2, 3)
- The computation cannot happen because the sizes don't match. It's going to be "Error"!
- \bigcirc c.shape = (3, 2)

Yes! This is broadcasting. b (column vector) is copied 3 times so that it can be summed to each column of a.

5. Consider the two following random arrays "a" and "b":

1 a = np.random.randn(4, 3) # a.shape = (4, 3) 2 b = np.random.randn(3, 2) # b.shape = (3, 2) 3 c = a*b

What will be the shape of "c"?

- c.shape = (4, 3)
- \bigcirc c.shape = (3, 3)
- The computation cannot happen because the sizes don't match. It's going to be "Error"!
- \bigcirc c.shape = (4,2)

Indeed! In numpy the "*" operator indicates element-wise multiplication. It is different from "np.dot()". If you would try "c = np.dot(a,b)" you would get c.shape = (4, 2).

6. Suppose you have n_x input features per example. Recall that $X = [x^{(1)}x^{(2)}...x^{(m)}]$. What is the dimension of X?

1 / 1 point

1 / 1 point

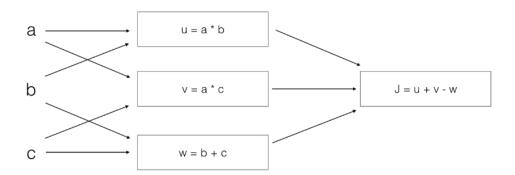

- \bigcirc (n_x,m)
- \bigcirc (m,n_x)
- \bigcirc (1,m)

 \bigcirc (m,1)Correct 7. Recall that "np.dot(a,b)" performs a matrix multiplication on a and b, whereas "a*b" performs an element-1 / 1 point wise multiplication. Consider the two following random arrays "a" and "b": 1 a = np.random.randn(12288, 150) # a.shape = (12288, 150) 2 b = np.random.randn(150, 45) # b.shape = (150, 45) 3 c = np.dot(a,b) What is the shape of c? c.shape = (12288, 45) c.shape = (12288, 150) c.shape = (150,150) The computation cannot happen because the sizes don't match. It's going to be "Error"! ✓ Correct Correct, remember that a np.dot(a, b) has shape (number of rows of a, number of columns of b). The sizes match because: "number of columns of a = 150 = number of rows of b" Consider the following code snippet: 1 / 1 point 1 # a.shape = (3,4)2 # b.shape = (4,1) 4 ▼ for i in range(3): 5 * for j in range(4):
6 c[i][j] = a[i][j] + b[j] 6 How do you vectorize this? \bigcirc c = a + b.T \bigcirc c = a.T + b.T c = a.T + b ○ c = a + b ✓ Correct Consider the following code: 1 / 1 point 1 a = np.random.randn(3, 3) 2 b = np.random.randn(3, 1)

What will be c? (If you're not sure, feel free to run this in python to find out).

3 c = a*b

- This will invoke broadcasting, so b is copied three times to become (3,3), and * is an element-wise product so c.shape will be (3, 3)
 This will invoke broadcasting, so b is copied three times to become (3, 3), and * invokes a matrix multiplication operation of two 3x3 matrices so c.shape will be (3, 3)
 This will multiply a 3x3 matrix a with a 3x1 vector, thus resulting in a 3x1 vector. That is, c.shape = (3,1).
 It will lead to an error since you cannot use "*" to operate on these two matrices. You need to instead use np.dot(a,b)
- 10. Consider the following computation graph.

1 / 1 point

What is the output J?

- $\int J = (c 1)*(b + a)$
- \bigcirc J = (a 1) * (b + c)
- $\int J = a*b + b*c + a*c$
- $\int J = (b 1) * (c + a)$
